

Safety (MSDS) data for vinegar

Vinegar is a dilute aqueous solution of acetic acid. It can be produced in a variety of ways, from wine, from the fermentation of grains, from dilution of acetic acid itself and so on. If you drink enough vinegar, you (unsurprisingly) won't feel too well. However, the data sheet for acetic acid, which outlines the hazards presented by the pure acid, should not be taken as representing the hazards (if any!) which might be associated with vinegar.
